AIM:

To create a **Java GUI based Feedback form for Hotels** which takes the details of all the hotels, feedbacks and persons who are giving feedback from the user. These values are to be updated in the database using **JDBC connectivity** .

ABSTRACT:

Feedback Retrieval System for Hotels

Feedback retrieval system for hotels basically helps all the hotels to collect feedback from people. This database stores all the details of users, hotels, feedbacks, services provided by the hotels.

The User enters his details first and checks the information of the hotel and then gives the feedback in form of suggestions and rating. The user will also post the complaints which will be further referred and improved by the management of the hotels. Users can also view the feedbacks given for other hotels by choosing the hotels. Users can also view the details of the hotels before the choose to stay in the hotel.

INTRODUCTION:

REQUIREMENT SPECIFICATION:

This database consists of 4 Entities namely Persons, Hotels, Services, Feedback and 3 relationships i.e.,

Person: Entity set contains the information of the person who gives feedback.

Attributes:

- Pid NUMBER(primary).
- Name VARCHAR
- Contact NUMBER(10)
- Mail VARCHAR2(20).

Hotels: It is an Entity set which contains the information of all the hotels.

Attributes:

- Name VARCHAR2(10)
- Hid NUMBER(2) (primary)
- Contact NUMBER(10)
- Address VARCHAR2(30).

Services: It is an entity which provides the information of services provided by the Hotel.

- Hid NUMBER(2)
- Sid NUMBER(5),
- Rooms VARCHAR2(100),
- Food VARCHAR2(100)
- Gamezone VARCHAR2(100),
- Ambience VARCHAR2(100).

Feedback: It helps in collecting the feedback from persons.

Attributes:

- Fid NUMBER(3) (primary)
- Complaints VARCHAR2(100)
- Suggestions VARCHAR2(100)
- Rating VARCHAR2(100)

Cardinalities:

- 1.Checks:Person checks the information of hotels.
- 2.Provides:Services provided by the hotel.
- 3.Gives:Feedback given by the user for a particular hotel.

The cardinalities are

a)Person(Many)-hotels(Many)

b) Person(one)-feedback(many).

This helps the organisation to improvise their hotels.

SOFTWARE USED:

Java Eclipse, Oracle 11g Database, Java SE version 7, SQL*Plus.

Java AWT (Abstract Window Toolkit) is an API to develop GUI or window-based applications in java.

Java AWT components are platform-dependent i.e. components are displayed according to the view of operating system. AWT is heavyweight i.e. its components are using the resources of OS.

The java.awt package provides classes for AWT API such as TextField, Label, TextArea, RadioButton, CheckBox, Choice, List etc.

JAVA SWING:

Swing is a GUI widget toolkit for Java. It is part of Oracle 's Java Foundation Classes (JFC) – an API for providing a graphical user interface (GUI) for Java programs. Swing was developed to provide a more sophisticated set of GUI components than the earlier Abstract Window Toolkit (AWT).

SQL:

Structure Query Language(SQL) is a database query language used for storing and managing data in Relational DBMS. SQL was the first commercial language introduced for E.F Codd's **Relational** model of database. Today almost all RDBMS (MySQL, Oracle, Infomix, Sybase, MS Access) use **SQL** as the standard database query language. SQL is used to perform all types of data operations in RDBMS.

NAME:K.GRETA

Java-SQL Connectivity using JDBC:

Java Database Connectivity (JDBC) is an application programming interface (API) for the programming language Java, which defines how a client may access a database. It is a Java-based data access technology used for Java database connectivity. It is part of the Java Standard Edition platform, from Oracle Corporation. It provides methods to query and update data in a database and is oriented towards relational databases.

The connection to the database can be performed using Java programming (JDBC API) as:

```
private void connToDb() {
    try {
        Class.forName("oracle.jdbc.driver.OracleDriver");
        connection =
DriverManager.getConnection("jdbc:oracle:thin:@localhost:1522:xe","greta","GRETA0910");

        statement = connection.createStatement();

    } catch (SQLException connectException) {
        System.out.println(connectException.getMessage());
        System.out.println(connectException.getSQLState());
        System.out.println(connectException.getErrorCode());
        System.exit(1);
    }
    catch (Exception e)
    {
        System.err.println("Unable to find and load driver");
        System.exit(1);
    }
}
```

Thus, the connection from Java to Oracle database is performed and therefore, can be used for updating tables in the database directly.

DESIGN:

1.ER DIAGRAM:

Tables

Created in SQL for above mentioned purpose is as:

Run SQL Command Line

SQL*Plus: Release 11.2.0.2.0 Production on Tue Feb 11 19:22:54 2020

DISCUSSION AND FUTURE WORK:

I want to create an app based on this mini project through which the data can be uploaded to the database so easily and also the backup will be maintained so that the data will be secured if there is any issue with the database.

CONCLUSION:

Thus, this Java AWT feedback retrieval system created which is connected to the Oracle 11g database. Therefore, all the entries in the form are directly updated on the tables created in the database.
